

Day 22 – HR Screening Dataset Creation

1. Objective

The HR Screening Dataset provides a structured, AI-ready question bank for automated HR screening calls.

The dataset is designed to support multiple job roles and organize screening questions into reusable categories.

2. Question Categories

The dataset includes the following screening categories:

- Introduction
- Education
- Experience
- Skills
- Location
- Salary
- Notice Period

3. Supported Job Roles

The current dataset contains screening questions for:

- Data Scientist
- Data Analyst
- Software Engineer

Each role contains questions covering all required screening categories.

4. Question Metadata

Each question is stored as an AI-ready question object containing:

- Question ID
- Category
- Question text
- Expected answer type
- Mandatory or optional status
- Scoring importance

5. Expected Answer Types

The dataset currently supports:

- Text
- Number
- Multiple choice

This structure allows the questions to be processed consistently by future AI screening and conversation modules.

6. Mandatory and Optional Questions

Questions are tagged as either:

- Mandatory
- Optional

Mandatory questions represent information required for the screening process, while optional questions provide additional candidate information.

7. Scoring Importance

Each question contains a scoring importance value from 1 to 3.

- 1 – Lower importance
- 2 – Moderate importance
- 3 – Higher importance

This allows future screening logic to prioritize important responses.

8. Dataset Structure

The dataset is stored at:

`data/hr_screening_dataset.json`

The structure contains:

HR Screening Dataset | --- Dataset Metadata --- Question Categories --- Supported Answer Types --- Roles
| --- Data Scientist --- Data Analyst --- Software Engineer | --- Introduction --- Education --- Experience +-
- Skills --- Location --- Salary --- Notice Period

9. AI Conversation Readiness

The question objects are structured so they can be consumed by future automated HR screening and conversational AI components.

Each question has a unique identifier and standardized metadata, making the dataset reusable across different screening workflows.

10. Testing

The Day 22 automated tests validate:

- Dataset existence
- Required question categories
- Multiple job roles
- Question object structure
- Mandatory and optional question tagging

- Scoring importance
- AI-ready question object format

Test Result

All Day 22 HR Screening Dataset tests passed successfully.

11. Day 22 Deliverables

The completed Day 22 work provides:

- HR screening question dataset
- Question category mapping
- AI conversation-ready question objects
- Reusable question metadata structure
- Multi-role screening question support
