Day 48 – Behavioral AI Research and Design

Objective

Create a privacy-conscious signal mapping framework.

Implementation

• Module: `scoring/behavioral_signal_framework.py`

• Explicit consent is required before supplied event metadata is analyzed.

• Window focus-loss count/duration are contextual observations only.

• Gaze stability, head movement, facial engagement and nervous gestures are explicitly non-scorable.

• No webcam capture, face/gaze model, emotion inference or candidate score is implemented.

Safeguards

Signals may be affected by disability, neurodiversity, culture, environment, assistive technology and technical interruptions. Do not infer honesty, competence, confidence or suitability. Provide notice, consent, accessibility alternatives, retention controls and human review.
