Day 49 – Malpractice and Integrity Detection Design

Objective

Generate threshold-based review flags from explicitly supplied session events.

Implementation

• Module: `interview_ai/integrity_detection_engine.py`

• Events: tab switch, window blur, external-voice indicator and looking-away indicator.

• Default thresholds: 3 tab switches, 3 window-blur events and 2 external-voice indicators.

• Thresholds create review alerts only. Looking-away indicators are never scored.

• Consent is required; unknown event types are rejected.

Limitations

The module does not monitor browsers, capture screens, record audio or establish malpractice. External-voice detection is not implemented; an indicator must come from a separately consented source. Technical interruptions and assistive technology can explain focus events. Human review is mandatory.
