Day 67 — Mock Demo Feedback

Day 67 — Mock Demo Feedback and Readiness Review

Review method

A structured desk-based rehearsal was performed against the supplied demo script, repository interfaces, synthetic dataset and current test evidence. This is **not** a recorded live stakeholder session; no external stakeholder feedback is claimed.

Review findings

Stakeholder Q&A; rehearsal

Q: Does the system make the final hiring decision?

A: No. It generates a structured recommendation for an authorized human reviewer. Human review remains mandatory.

Q: Are all scores generated by machine-learning models?

A: No. The current implementation includes rule-based and rubric-based components. The exact method varies by module.

Q: Does the demo process a real uploaded resume end to end?

A: The simulator uses supplied structured inputs. The API upload route stores the uploaded file and creates a demonstration job record; the repository documentation identifies the parser integration boundary. The synthetic demo does not prove a complete production upload-to-decision workflow.

Q: How are scores combined?

A: A role-specific weighted average is calculated across available rounds. Missing rounds are excluded and the remaining weights are renormalized. Coverage is reported separately.

Q: Is the confidence score a probability?

A: No. It is a coverage-based heuristic and should not be interpreted as statistical confidence.

Q: Does the machine test execute candidate code?

A: No. The current machine-test component evaluates supplied test outcomes and rubric fields; it does not execute untrusted candidate code.

Q: What happens when a round is missing?

A: The aggregation output identifies missing rounds, reports reduced coverage and renormalizes the weights of the available rounds. Recommendation logic can hold a candidate for insufficient coverage.

Q: Is the platform production-ready?

A: This is an internship prototype. The current API uses in-memory stores and the observability/audit utilities are in-process. Production deployment would require persistent storage, authentication/authorization, secure file handling, queue infrastructure, monitoring, privacy review and operational validation.

Q: What is the business value?

A: The prototype aims to structure evidence and make review more consistent. Quantified time savings, accuracy gains or hiring-quality improvements have not been measured.

Readiness checklist

- [ ] Run the demo script from repository root.
- [ ] Run the full local test suite with project dependencies installed.
- [ ] Open both Mermaid diagrams in a Markdown renderer.
- [ ] Keep a copy of the demo dataset and output available.
- [ ] Rehearse the 10–12 minute script aloud.
- [ ] Prepare to explain limitations and human oversight.
- [ ] Do not use real applicant data in the demo.
