Day 56 – Full System Simulation

Objective

Exercise the hiring workflow from structured resume input through ATS, screening, HR interview, technical interview, machine test, aggregation and recommendation.

Implementation

The simulator uses existing scoring modules and deterministic structured fixtures. It records each stage, the five round scores, the unified recommendation and an optional comparison with a supplied human recommendation.

Scope boundary

The resume text is accepted as a simulated upload input. This test does not exercise a real file-upload transport, OCR or document extraction. Human comparison is descriptive; one fixture cannot establish model accuracy or replace expert review.
