Day 57 – Debugging & Stabilization

Objective

Improve validation and predictable error contracts around scoring and API responses.

Implementation

A reusable validator rejects booleans, non-numeric values, NaN, infinity and scores outside 0–100. It also checks the standard success envelope and produces a consistent error envelope.

Verification

Focused tests cover boundaries, malformed values, missing response fields and error formatting. Existing scoring modules are not silently rewritten; apply the validator at integration boundaries and migrate modules incrementally.
