Day 59 – API & Integration Planning

Objective

Define module boundaries, request/response contracts, processing modes, security and error handling.

API inventory

Resume parsing, ATS scoring, screening AI, interview AI and decision AI. Resume processing is asynchronous; real-time interview scoring is synchronous, as specified in the task brief.

Integration flow

Backend authenticates the caller, validates a versioned request, persists an application/job reference, invokes the relevant AI service, stores the result and returns either a synchronous result or an asynchronous job reference. Do not pass raw transcripts or resume contents into application logs.

Reliability

Use correlation IDs, idempotency keys for resume jobs, bounded retries with exponential backoff and jitter for transient failures, dead-letter handling after retry exhaustion, explicit timeouts and stable error codes. Do not retry validation or authorization failures.

Security

TLS in transit, service-to-service authentication, least-privilege authorization, secret management, encrypted storage, retention/deletion enforcement and audit events. The schemas in this folder are design contracts, not deployed endpoints.
