Day 51 – Cross-Round Aggregation Engine

Objective

Combine ATS, screening, HR interview, technical interview and machine-test scores into one hiring-fit score.

Implementation

• Role-specific weights are provided for roles already represented in the project and related developer roles.

• Validate scores on a 0–100 scale.

• Missing rounds are excluded; remaining weights are renormalized.

• Return per-round configured/effective weights, missing rounds and coverage.

Limitation

The engine consumes upstream scores; it does not invent missing values or call upstream systems. Initial weights require business validation.
